Forward L1 - Learning Reflections and Intentions Blog

Question 1: What is the most relevant learning from the Foundation Level for you?

What stood out for me the most is that while developing a solution, one should work on the AGILE method rather than the conventional step by step method which would take awhile to develop and would not give enough room for feedback and prompt improvement. Unlike the AGILE method which gives room for feedback immediately when a feature is developed, the conventional method would take awhile to develop before even rolling it out for the end users to test and give feedback.
Another key point I leant is that one needs to consider the end users of a product while developing a product, so as to meet the demands of the customers. And for this to also take effect, EMPATHY is also needed so as to know the end users concerns per time.
Finally, it's important to learn problem solving and being able to break down tasks and challenges as well as accommodating changes that may come along the way because it's a thing of discovery and not just rigidity.

Question 2: Set a meaningful learning intention you'd like to focus on in the next month or two.

 I'll personally thrive to ensure that my team improves on proper communication amongst themselves to foster good team bonding. And to help develop a system that works for the organization, I'll consult with my colleagues to get feedback on the existing tracking system and ask for ways to better improve it so that it can be real-time so as to improve the team's efficiency and productivity while working daily. It'll also be crucial to teach the team better ways to go digital so as to improve our lives.
